

**Development of specific remedy for Alzheimer type dementia
by Vanadium V⁵⁺ ion water**

Proposal for investment participation in clinical trials for confirmation of specific remedy.

1. Many of the other recently published papers, including the hypotheses proposed by the Harvard University Neurological Disorders Group, and as written in the separate paper “Development of specific remedy for Alzheimer type dementia by Vanadium V⁵⁺ ion water” and judging from the fact that three elderly people with Alzheimer's symptoms improved in the short term due to drinking V⁵⁺ ion water we experienced, the underlying cause of the onset (AD) was the loss of homeostasis of Ca²⁺ concentration in brain neurons. It seems that there is almost no doubt that the underlying cause of the onset of (AD) is the loss of homeostasis of Ca²⁺ concentration in brain neurons.

However, it is difficult to inject appropriate amount of Ca²⁺ into brain neurons and therefore testing of hypotheses has not progressed and advances in those theories have not been made. The intracellular Ca²⁺ concentration is rapidly increased by the action similar to that of a long-acting inotropic agent such as uwabaine which has long been known by drinking highly physiological "V⁵⁺", and the endoplasmic reticulum which is a storage of Ca²⁺ since Ca²⁺ is sufficiently accumulated, Ca²⁺ homeostasis in brain neurons is restored.

And the case that three elderly people with Alzheimer's symptoms rapidly recovered by drinking “V⁵⁺” 14 and 15 years ago seemed to be a mysterious phenomenon at that time, but it can be rationally understood by the restoration of homeostasis of Ca²⁺. The clinical trials of above title confirm the efficacy of "V⁵⁺" against (AD) and establish one scientific truth.

And by patenting, huge intellectual property is born and can save many of the world's AD.

The clinical trials are scheduled for Tohoku University and Kitasato University in Japan.

2. Investment outline

(1) Conditions of investment amount

We plan to offer it to Japanese investors too and therefore, we have to discuss the amount.

(2) Securing highly active vanadium pentavalent ion water

There are several candidate wells, and all have good relationships, and there is no limit in quantity.

3. Shape of product

(1) Natural water status (500cc to 2 L plastic bottles)

Functional food labeling permission to be obtained

(2) Concentrated solution (5 to 10 times) Drug toxicity test required

(3) Tableting drug from vanadium pentoxide. Drug toxicity test required

4. Side effects and toxicity

The candidate wells are located around Oshinomura Village, Yamanashi Prefecture, which is famous as a longevity area. And there is no problem at all because the residents there have been using it for living water since history.
